

First visit, 22 days of work

I already used one week, so we have 22 days left. That is not a small window. The new first visit is already drawn. These 22 days I watch users, fix where they get stuck, count the steps, and post the result in this group. If the tests show we need more design, I will do it. I will not run a live demo unless you ask.

You said

Flawless setup. They understand Orion and the other features. They come back again and again.

That is still the goal. In these 22 days we make the first visit work, meaning our users finish setup, know what Orion is, and see the other parts of the app, so they can come back. Coming back again and again takes more than 22 days, and we still want that, but we will work on it after this and not use it as the grade for these 22 days.

The whole goal

Where we are going

Our users finish setup and do not get stuck

They know what Orion is for

They know what else is in the app

They come back again and again

These 22 days

What we will count

Did the first visit work for our users: setup, Orion, and the other parts of the app. We will also make it easy to come back, and we will count "again and again" later, once users have had time to return.

We did well in these 22 days if all three of these are true

1

Setup

A new Flable user can connect an ad account and get into the app without getting stuck. We count how many of those users finish Connect.

2

They know Orion

Our users can tell us what Orion is for, and they finish the Orion questions or ask Orion one question. We count how many users do that.

3

Other parts of the app

Our users see Pulse, Attribution, Insights and more, not only chat. We count how many finish the short tour or open two parts of the app.

What I promise

The flow is drawn. These 22 days I fill it: watch, fix, count, write it down

Every week has a file in this group, not a call. Day 7: how the path works today and what the first watches showed. Day 14: the three stuck places and what I changed. Day 22: three numbers and whether we show more users. I will not ask to show this to every user until a small group can finish setup, say what Orion is, and point to one part of the app that is not chat.

Four jobs, one first visit

The path is already made: pick a profile, connect ads, confirm the brand, pick a plan, then a short tour and Orion. Now we count each step, watch our users, and fix what fails, with more design if we need it. Updates go in this group as notes, not as a demo call.

Job 1. Count the first visit

Screens will not tell us if we won, so first I write down how the path works today.

I list every step: sign up, pick a profile, connect ads, confirm the brand, pick a plan, start the tour, finish the tour, start Orion, finish Orion, send the first chat. Then I ask the engineers to record each of those steps in our analytics tool, which is the software that stores “this user finished Connect” without anyone watching. If analytics is not ready in the first week, I still run the user testing calls and write what each customer did in a Google Sheet, so we are not guessing.

The job is done when every step has a name we can count and we know today’s number, even if that number is bad. We will know by how many users start each step and how many finish, and how long it takes from sign up to Connect.

Job 2. Make setup easy

The screens are already there: profile, connect Meta, Google or Shopify, confirm the brand, pick a plan.

Sales asks five Flable customers to join a user testing call (about 30 minutes on Zoom or Google Meet). We can give credits or a referral code so they opt in. The customer shares their screen and clicks the new first visit while I watch, remote. I do not help unless they are stuck for a long time, and I write where they stop. If five calls are slow to book, I watch recordings of new signups instead, or sales asks three questions at the end of their next five calls. Then I change the words, the buttons, or the order, and I will do more design if that is what it takes. I will fix the three worst stuck places, which is often Connect feeling scary, a plan showing up before they have seen anything useful, or a step that never says why they are doing it.

The job is done when those three stuck places are fixed. We will know by how many users finish Connect, how long setup takes, and whether anyone writes to support and says they got stuck.

Job 3. They know what Orion is

The Orion questions are already there: who it works for, what to make better, where to push, how often to reach them, then the first chat.

A new Flable user should be able to say *“Orion watches my ads and tells me what to do next.”* They finish the short Orion questions or they ask Orion one real question, and if they cannot say that sentence we are not done, so I will change the words (and the screens if I must) until they can.

The job is done when four of the five customers on the calls can say what Orion is for in one sentence. We will know by how many users finish the Orion questions or send one chat, and I will write down the five answers they say out loud.

Job 4. They see the other parts of the app, and they know how to come back

The short tour is already there (sidebar, agents, the box where you type, partners, setup) and so is the setup list (personalize, connect, fix ad tracking, free credits).

Each stop on the tour must say the name of the thing and why it is there, so after the tour a user can point to one part of the app that is not chat. I will rewrite those stops and the setup list (personalize, connect, fix ad tracking, credits) so coming back is obvious. We do not grade “again and again” in these 22 days, we make it clear how to come back.

The job is done when four of the five customers on the calls can name one part of the app besides Orion chat. We will know by how many users finish the tour or open two parts of the app, and whether they started the setup list.

The next 22 days, in order

This is exactly what I will do, how I will do it, and what I will use, starting day 1 when you say yes

Days	What I will do	How I will do it	What I will use
1 to 7	Write today's path, name every step for analytics, start the five watches Open the live app and the new flow. Write every step in a list and give engineering the names to record in our analytics tool (the software that stores "this user finished Connect"). Write one line sales can paste: credits or a referral code for a 30 minute watch. Sales asks five Flable customers. I run those calls remote on Zoom or Google Meet: the customer shares their screen, I watch, I do not help. If booking is slow I watch recordings of new signups, or sales asks three questions on their next five calls. Day 7 I post a note in this group: the step list, what we already saw, what is still missing.	I put the steps in a Google Sheet with columns for customer, step, did they finish, where they stopped, and what they said. On the call I do not help unless they are stuck for a long time. If analytics is not ready yet, the Sheet from these watches is our count. I work remote, so this is never an office visit. The day 7 note is a file in the group, not a live walkthrough.	Live app, new flow, Google Sheet, Zoom or Google Meet, credits or a referral code, recordings if calls are slow, our analytics tool once engineering turns the steps on
8 to 14	Finish the five watches, fix the three worst stuck places, rewrite the tour Same watches as days 1 to 7 for the rest of the five customers. Then I change the new flow (words, buttons, or order) and I will do more design if that is what it takes. I rewrite each tour stop so it says the name and why it is there, and I make the setup list the reason to come back. Day 14 I post a note in this group: where they got lost, what I changed. No live demo unless you ask.	I keep filling the same Google Sheet and rank the stuck places by how many customers hit them. I fix the top three in the flow we already have, plus any extra design the watches prove we need. The day 14 note is the update. You do not need a call to see it.	Same Google Sheet, same Zoom or Google Meet or recordings, the new flow files, tour copy, setup list, and chat with engineering if a fix needs analytics or a small live change
15 to 19	Some new Flable users see the new first visit, not everyone I ask engineering to show the new flow to a small group of new signups. Each day I watch the three numbers: how many finish Connect, how many finish Orion or send one chat, and how many finish the tour or open two parts of the app. If users still get stuck I fix one more thing, including more design if needed, and I read support notes that say they got lost. I post a one line status in the group if a number drops.	Engineering turns the new flow on for some new signups only. I check the analytics tool each morning and write a one line note if a number drops, then one more fix if setup or Orion still stops users.	Analytics tool, live app, support inbox, the new flow files, chat with engineering
20 to 22	I give you one page of numbers The three numbers next to day 1, what the five customers said on the calls, what we will not show every user yet, and what we do next (come back again and again). If the small group did well we can show more users, and if it did not I will say so and keep fixing.	I copy the numbers from the analytics tool and the Google Sheet into one short page, add five short quotes from the watches, and post that page in this group on day 22. If you want a call after you have read it, you say so.	Google Sheet, analytics tool, one page PDF or a short doc in this group

How we know it worked

We use your words, then we count. Here is the grade for these 22 days.

You care about	What I will count	We did well in 22 days if
Flawless setup	How many new signups finish Connect. How long it takes to get in. Notes that say "I got stuck."	The number is better than day 1, or four of the five customers on the calls finish without help
They understand Orion	How many finish the Orion questions or send one real chat. The sentence they say out loud.	Four of the five customers on the calls can say what Orion is for, and the count is better than day 1
Other features	How many finish the tour or open two parts of the app that are not only chat.	Four of the five customers on the calls can name one part of the app besides chat
Come back again and again	Did they start the setup list. Do they know where to return.	This is not the grade for these 22 days. I will still tell you if any user came back, and the next stretch of work will own this

What I need from you

1

Say this plan is ok, or write a better one: first visit, 22 days, these three numbers. I will do the one the group picks.

2

Sales: five Flable customers for a 30 minute watch (credits or a referral code), or a yes to recordings / three questions on sales calls if booking is too slow.

3

Engineering: record the steps in our analytics tool, and show the new flow to some new users first. I will post notes in this group on day 7, 14, and 22. No demo call unless you ask.

If we finish early

I will not stop

I will cut steps that nobody needed, make a clear note that says your first Orion note is waiting so coming back is obvious, and start a small count of which users come back for next time (that count is not how we pass these 22 days).

If almost no new users sign up, we still use the five customer calls and the three "four of five" checks. I will not make up a percent from ten users.
